0.1 Section B

B1. Create a Git repository and add both Python files.

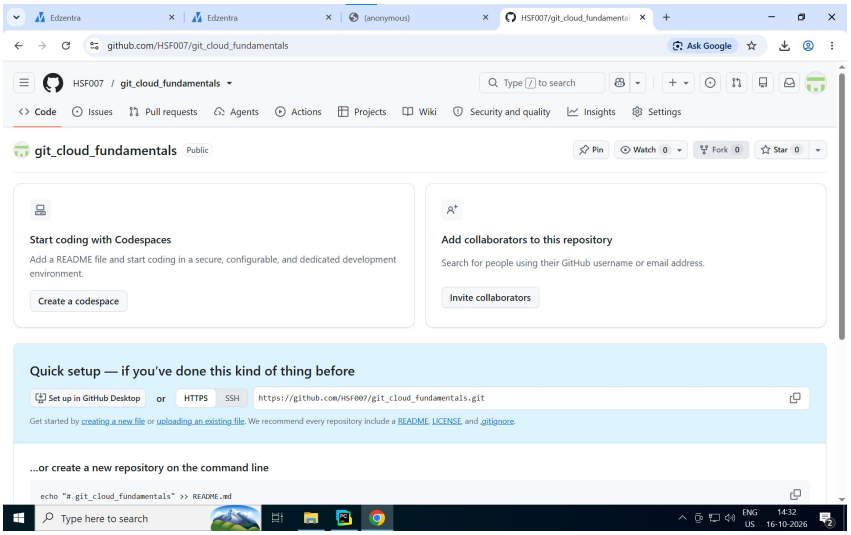

Figure 1: Create a Git repository

B2. Run git status, stage the files, create the first commit and push the repository.

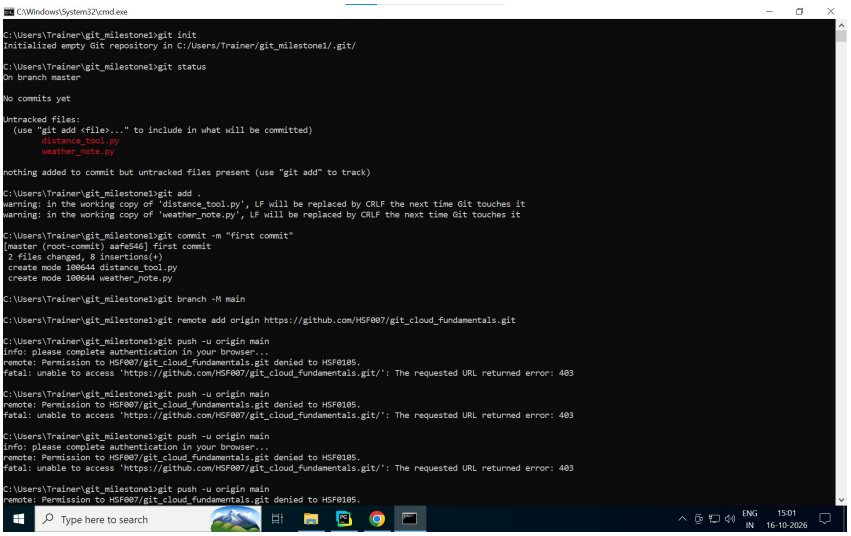

Figure 2: Run git status, stage the files, create the first commit

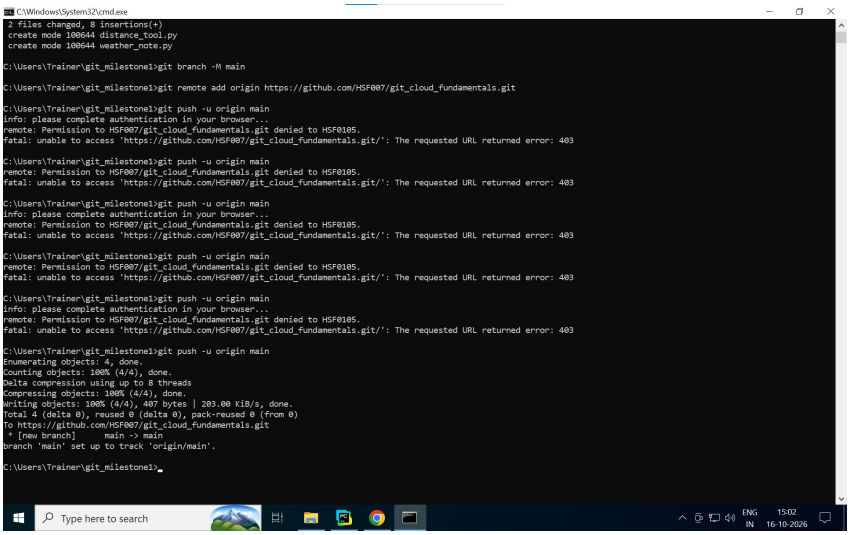

Figure 3: Push the repository

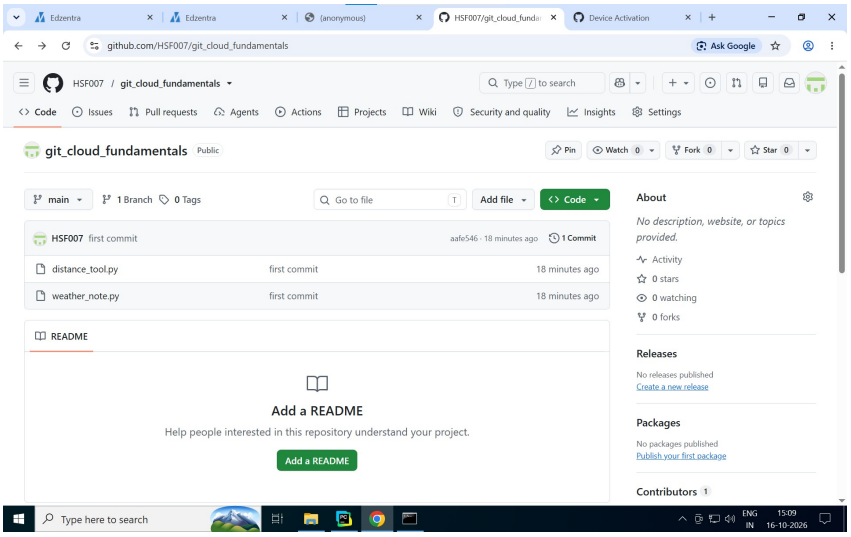

Figure 4: Git repository after pushing files

B3. Create a branch named feature-update. Modify one Python file, commit the change and push the branch.

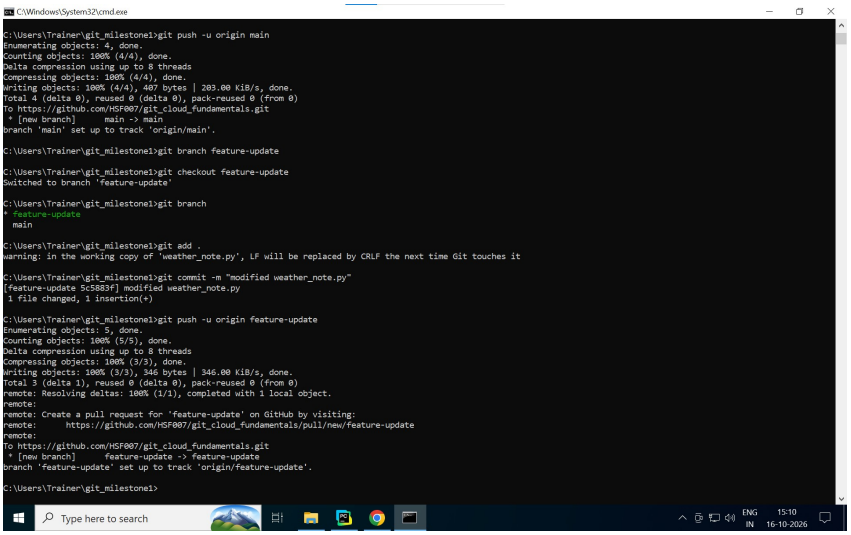

Figure 5: Create a branch named feature-update, commit the change and push the branch

B4. Create a pull request from feature-update to main.

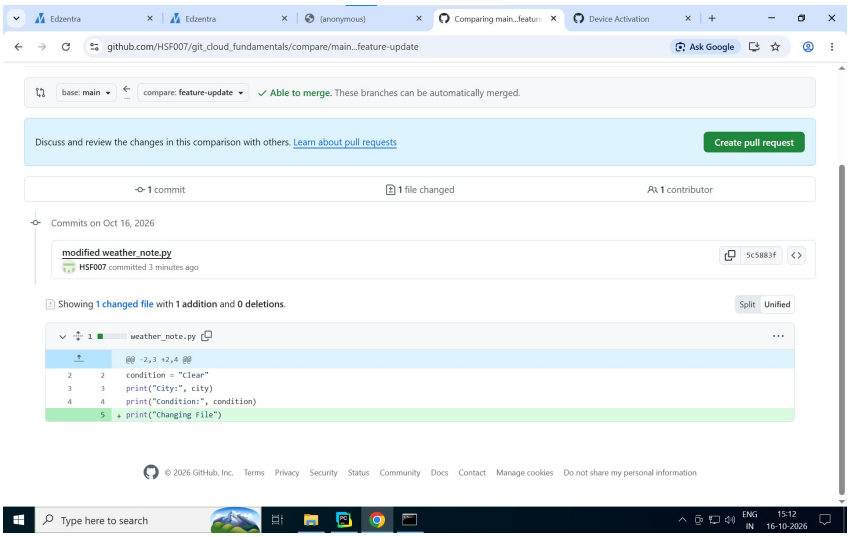

Figure 6: Creating Pull request

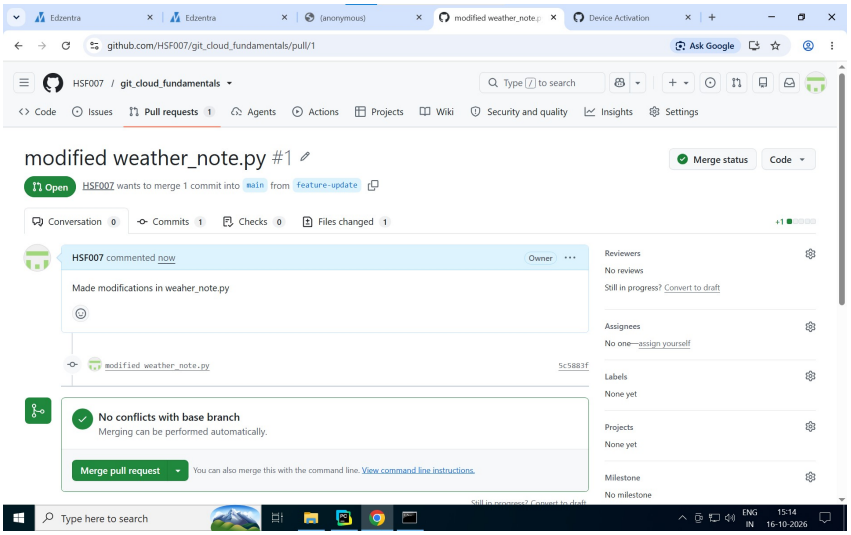

Figure 7: Successfully created pull request

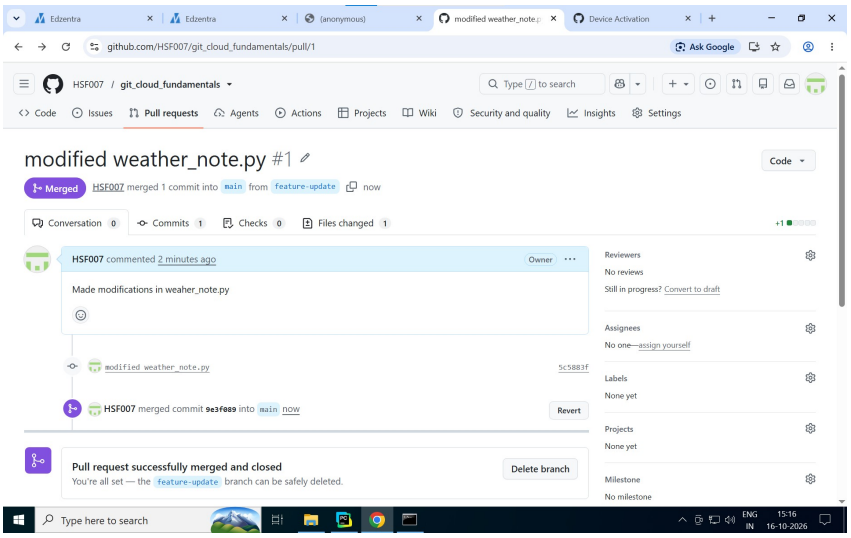

Figure 8: Merged the changes in feature-update brach in main branch

B5. What is the difference between cloud infrastructure and on-premises infrastructure?

Cloud infrastructure uses servers, storage, and networking hosted by a cloud service provider and accessed over the internet. It's scalable, requires less investment, and is paid for based on usage.

On-premise infrastructure uses servers and other IT equipment installed and mantained at an organization's own location.It's requires higher initila costs and ongoing maintenance.

B6. What is an Azure subscription?

An Azure subscription is container which allows to create and mange cloud resources. It's also used to manage billing and costs.

B7. What is an Azure Resource Group?

Azure Resource Group is a container used to organize and manage related Azure resources

such as virtual machine, storage account, and databases as a single unit

B8. Arrange these in the correct hierarchy: Resource, Subscription, Resource Group

```
Subscription -> Resource Group -> Resource
```

B9. Why might a company place related Azure resources in the same Resource Group?

A company groups related Azure resources together to make them easier to manage, organize and control access.
